

TMP112 High-Accuracy, Low-Power, Digital Temperature Sensor with SMBus™ and Two-Wire Serial Interface in SOT563

1 Features

- SOT563 Package (1.6 mm × 1.6 mm) is 68% smaller footprint than SOT23
- Accuracy Without Calibration:
 - 0.5°C (max) from 0°C to +65°C
 - 1.0°C (max) from -40°C to +125°C
- Low Quiescent Current:
 - 10µA Active (max), 1µA Shutdown (max)
- Supply Range: 1.4V to 3.6V
- Resolution: 12 Bits
- Digital Output: SMBus™, Two-Wire and I²C Interface Compatibility

2 Applications

- Portable and Battery-Powered Applications
- Power-Supply Temperature Monitoring
- Computer Peripheral Thermal Protection
- Notebook Computers
- Battery Management
- Office Machines
- Thermostat Controls
- Electromechanical Device Temperatures
- General Temperature Measurements:
 - Industrial Controls
 - Test Equipment
 - Medical Instrumentation

3 Description

The TMP112 device is a digital temperature sensor ideal for NTC/PTC replacement where high accuracy is required. The device offers an accuracy of $\pm 0.5^\circ\text{C}$ without requiring calibration or external component signal conditioning. IC temperature sensors are highly linear and do not require complex calculations or lookup tables to derive the temperature. The calibrating for improved accuracy feature allows users to calibrate for an accuracy as good as $\pm 0.17^\circ\text{C}$ (see the [Calibrating for Improved Accuracy](#) section). The on-chip 12-bit ADC offers resolutions down to 0.0625°C.

The 1.6-mm × 1.6-mm SOT563 package is 68% smaller footprint than an SOT23 package. The TMP112 device features SMBus™, two-wire and I²C interface compatibility, and allows up to four devices on one bus. The device also features an SMBus alert function. The device is specified to operate over supply voltages from 1.4 to 3.6 V with the maximum quiescent current of 10 µA over the full operating range.

The TMP112 is ideal for extended temperature measurement in communication, computer, consumer, environmental, industrial, and instrumentation applications. It is specified for operation over a temperature range of -40°C to +125°C.

Device Information⁽¹⁾

5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (June 2009) to Revision C	Page
• Added <i>Handling Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	4

Changes from Revision A (March 2009) to Revision B	Page
• Changed footnote 1 of Table 14	22
• Clarified Example 1; extended worst-case accuracy to be from –15°C to +50°C	22

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SCL	I	Serial clock. Open-drain output; requires a pullup resistor.
2	GND	—	Ground
3	ALERT	O	Overtemperature alert. Open-drain output; requires a pullup resistor.
4	ADD0	I	Address select. Connect to GND or V+
5	V+	I	Supply voltage, 1.4 to 3.6 V
6	SDA	I/O	Serial data. Open-drain output; requires a pullup resistor.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	V+		5	V
Input voltage	SCL, ADD0, and SDA	-0.5	5	V
Input voltage	ALERT	-0.5	(V+) + 0.5	V
Output voltage		-0.5	5	V
Operating temperature		-55	150	°C
Junction temperature, T _J			150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 Handling Ratings

			MIN	MAX	UNIT
T _{stg}	Storage temperature range		-60	+150	°C
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	-2000	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	-1000	1000	
		Machine Model (MM)	-200	200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V ₊	Supply Voltage	1.4	3.3	3.6	V
T _A	Operating free-air temperature	-40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TMP112	UNIT
		DRL

8 Detailed Description

8.1 Overview

The TMP112 device is a digital temperature sensor that is optimal for thermal-management and thermal-protection applications. The TMP112 device is two-wire, SMBus and I²C interface-compatible. The device is specified over an operating temperature range of -40°C to 125°C. [Figure 8](#) shows a block diagram of the TMP112 device. [Figure 9](#) shows the ESD protection circuitry contained in the TMP112 device.

The temperature sensor in the TMP112 device is the chip itself. Thermal paths run through the package leads as well as the plastic package. The package leads provide the primary thermal path because of the lower thermal resistance of the metal.

An alternative version of the TMP112 device is available. The TMP102 device has reduced accuracy, the same micro-package, and is pin-to-pin compatible.

Table 1. Advantages of TMP112 Versus TMP102

Device	Compatible Interfaces	Package	Supply Current	Supply Voltage (Min)	Supply Voltage (Max)	Resolution	Local Sensor Accuracy (Max)	Specified Calibration Drift Slope
TMP112	I ² C SMBus	SOT563 1.2 × 1.6 × 0.6	10µA	1.4V	3.6V	12 Bit 0.0625°C	0.5°C: (0°C to 65°C) 1°C: (-40°C to 125°C)	Yes
TMP102	I ² C SMBus	SOT563 1.2 × 1.6 × 0.6	10µA	1.4V	3.6V	12 Bit 0.0625°C	2°C: (25°C to 85°C) 3°C: (-40°C to 125°C)	No

Functional Block Diagram (continued)

Figure 9. Equivalent Internal ESD Circuitry

8.3 Feature Description

8.3.1 Digital Temperature Output

The digital output from each temperature measurement conversion is stored in the **read-only** temperature register. The temperature register of the TMP112 device is configured as a 12-bit read-only register (setting the EM bit to 0 in the configuration register; see the [Extended Mode \(EM\)](#) section), or as a 13-bit read-only register (setting the EM bit to 1 in the configuration register) that stores the output of the most recent conversion. Two bytes must be read to obtain data and are listed in [Table 8](#) and [Table 9](#). Byte 1 is the most significant byte (MSB), followed by byte 2, the least significant byte (LSB). The first 12 bits (13 bits in extended mode) are used to indicate temperature. The least significant byte does not have to be read if that information is not needed. The data format for temperature is listed in [Table 2](#) and [Table 3](#). **One LSB equals 0.0625°C**. Negative numbers are represented in binary twos complement format. Following power up or reset, the temperature register reads 0°C until the first conversion is complete. Bit D0 of byte 2 indicates normal mode (EM bit equals 0) or extended mode (EM bit equals 1), and can be used to distinguish between the two temperature register data formats. The unused bits in the temperature register always read 0.

Table 2. 12-Bit Temperature Data Format⁽¹⁾

TEMPERATURE (°C)	DIGITAL OUTPUT (BINARY)	HEX
128	0111 1111 1111	7FF
127.9375	0111 1111 1111	7FF
100	0110 0100 0000	640
80	0101 0000 0000	500
75	0100 1011 0000	4B0
50	0011 0010 0000	320
25	0001 1001 0000	190
0.25	0000 0000 0100	004
0	0000 0000 0000	000
-0.25	1111 1111 1100	FFC
-25	1110 0111 0000	E70
-55	1100 1001 0000	C90

(1) The resolution for the Temp ADC in Internal Temperature mode is 0.0625°C/count.

Table 2 does not list all temperatures. Use the following rules to obtain the digital data format for a given temperature or the temperature for a given digital data format.

To convert positive temperatures to a digital data format:

1. Divide the temperature by the resolution
2. Convert the result to binary code with a 12-bit, left-justified format, and MSB = 0 to denote a positive sign.

Example: $(50^{\circ}\text{C}) / (0.0625^{\circ}\text{C} / \text{LSB}) = 800 = 320\text{h} = 0011\ 0010\ 0000$

To convert a positive digital data format to temperature:

1. Convert the 12-bit, left-justified binary temperature result, with the MSB = 0 to denote a positive sign, to a decimal number.
2. Multiply the decimal number by the resolution to obtain the positive temperature.

Example: $0011\ 0010\ 0000 = 320\text{h} = 800 \times (0.0625^{\circ}\text{C} / \text{LSB}) = 50^{\circ}\text{C}$

To convert negative temperatures to a digital data format:

1. Divide the absolute value of the temperature by the resolution, and convert the result to binary code with a 12-bit, left-justified format.
2. Generate the two's complement of the result by complementing the binary number and adding one. Denote a negative number with MSB = 1.

Example: $(|-25^{\circ}\text{C}|) / (0.0625^{\circ}\text{C} / \text{LSB}) = 400 = 190\text{h} = 0001\ 1001\ 0000$

Two's complement format: $1110\ 0110\ 1111 + 1 = 1110\ 0111\ 0000$

To convert a negative digital data format to temperature:

1. Generate the two's compliment of the 12-bit, left-justified binary number of the temperature result (with MSB = 1, denoting negative temperature result) by complementing the binary number and adding one. This represents the binary number of the absolute value of the temperature.
2. Convert to decimal number and multiply by the resolution to get the absolute temperature, then multiply by -1 for the negative sign.

Example: $1110\ 0111\ 0000$ has two's compliment of $0001\ 1001\ 0000 = 0001\ 1000\ 1111 + 1$

Convert to temperature: $0001\ 1001\ 0000 = 190\text{h} = 400; 400 \times (0.0625^{\circ}\text{C} / \text{LSB}) = 25^{\circ}\text{C} = (|-25^{\circ}\text{C}|); (|-25^{\circ}\text{C}|) \times (-1) = -25^{\circ}\text{C}$

Table 3. 13-Bit Temperature Data Format

TEMPERATURE ($^{\circ}\text{C}$)	DIGITAL OUTPUT (BINARY)	HEX
150	0 1001 0110 0000	0960
128	0 1000 0000 0000	0800
127.9375	0 0111 1111 1111	07FF
100	0 0110 0100 0000	0640
80	0 0101 0000 0000	0500
75	0 0100 1011 0000	04B0
50	0 0011 0010 0000	0320

-25	1 1110 0111 0000	1E70
-55	1 1100 1001 0000	1C90

8.3.2 Serial Interface

The TMP112 device operates as a slave device only on the SMBus, two-wire and I²C interface-compatible bus. Connections to the bus are made through the open-drain I/O lines, SDA and SCL. The SDA and SCL pins feature integrated spike suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. The TMP112 device supports the transmission protocol for both fast (1 kHz to 400 kHz) and high-speed (1 kHz to 2.85 MHz) modes. All data bytes are transmitted MSB first..

8.3.2.1 Bus Overview

The device that initiates the transfer is called a *master*, and the devices controlled by the master are *slaves*. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions.

To address a specific device, a START condition is initiated, indicated by pulling the data-line (SDA) from a high-to low-logic level while the SCL pin is high. All slaves on the bus shift in the slave address byte on the rising edge of the clock, with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the slave being addressed responds to the master by generating an acknowledge and pulling the SDA pin low.

A data transfer is then initiated and sent over eight clock pulses followed by an acknowledge bit. During the data transfer the SDA pin must remain stable while the SCL pin is high, because any change in the SDA pin while the SCL pin is high is interpreted as a START or STOP signal.

When all data have been transferred, the master generates a STOP condition indicated by pulling the SDA pin from low to high, while the SCL pin is high.

8.3.2.2 Serial Bus Address

To communicate with the TMP112 device, the master must first address slave devices through a slave-address byte. The slave-address byte consists of seven address bits and a direction bit indicating the intent of executing a read or write operation.

The TMP112 device features an address pin to allow up to four devices to be addressed on a single bus. [Table 4](#) describes the pin logic levels used to properly connect up to four devices.

Table 4. Address Pin and Slave Addresses

DEVICE TWO-WIRE ADDRESS	A0 PIN CONNECTION
1001000	Ground
1001001	V+
1001010	SDA
1001011	SCL

8.3.2.3 Writing and Reading Operation

Accessing a particular register on the TMP112 device is accomplished by writing the appropriate value to the pointer register. The value for the pointer register is the first byte transferred after the slave address byte with the R/W bit low. Every write operation to the TMP112 device requires a value for the pointer register (see [Figure 11](#)).

When reading from the TMP112 device, the last value stored in the pointer register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the pointer register. This action is accomplished by issuing a slave-address byte with the R/W bit low, followed by the pointer register byte. No additional data are required. The master can then generate a START condition and send the slave address byte with the R/W bit high to initiate the read command. See [Figure 12](#) for details of this sequence. If repeated reads from the same register are desired, continuously sending the pointer register bytes is not necessary because the TMP112 device retains the pointer register value until the value is changed by the next write operation.

Register bytes are sent with the most significant byte first, followed by the least significant byte.

8.3.2.4 Slave Mode Operations

The TMP112 device can operate as a slave receiver or slave transmitter. As a slave device, the TMP112 device never drives the SCL line.

8.3.2.4.1 Slave Receiver Mode

The first byte transmitted by the master is the slave address with the R/W bit low. The TMP112 device then acknowledges reception of a valid address. The next byte transmitted by the master is the pointer register. The TMP112 device then acknowledges reception of the pointer register byte. The next byte or bytes are written to the register addressed by the pointer register. The TMP112 device acknowledges reception of each data byte. The master can terminate data transfer by generating a START or STOP condition.

8.3.2.4.2 Slave Transmitter Mode

The first byte transmitted by the master is the slave address with the R/W bit high. The slave acknowledges reception of a valid slave address. The next byte is transmitted by the slave and is the most significant byte of the register indicated by the pointer register. The master acknowledges reception of the data byte. The next byte transmitted by the slave is the least significant byte. The master acknowledges reception of the data byte. The master can terminate data transfer by generating a *not-acknowledge* on reception of any data byte or by generating a START or STOP condition.

8.3.2.5 SMBus Alert Function

The TMP112 device supports the SMBus alert function. When the TMP112 device operates in interrupt mode ($T_M = 1$), the ALERT pin can be connected as an SMBus alert signal. When a master senses that an alert condition is present on the alert line, the master sends an SMBus **ALERT command (0001 1001)** to the bus. If the **ALERT** pin is active, the device acknowledges the SMBus ALERT command and responds by **returning the slave address** on the SDA line. The eighth bit (LSB) of the slave address byte indicates if the alert condition is caused by the temperature exceeding $T_{(HIGH)}$ or falling below $T_{(LOW)}$. The LSB is high if the temperature is greater than $T_{(HIGH)}$, or low if the temperature is less than $T_{(LOW)}$. Refer to the [Figure 13](#) section for details of this sequence.

If multiple devices on the bus respond to the SMBus ALERT command, arbitration during the slave address portion of the SMBus ALERT command determines which device clears the alert status of that device. The device with the **lowest two-wire address wins the arbitration**. If the TMP112 device wins the arbitration, the TMP112 ALERT pin becomes inactive at the completion of the SMBus ALERT command. If the TMP112 device loses the arbitration, the TMP112 ALERT pin remains active.

8.3.2.6 General Call

The TMP112 device responds to a two-wire general-call address (0000 000) if the eighth bit is 0. The device acknowledges the general-call address and responds to commands in the second byte. If the second byte is 0000 0110, the TMP112 internal registers are reset to power-up values. The TMP112 device does not support the general-address acquire command.

8.3.2.7 High-Speed (Hs) Mode

In order for the two-wire bus to operate at frequencies above 400 kHz, the master device must issue an Hs-mode master code (0000 1xxx) as the first byte after a START condition to switch the bus to high-speed operation. The TMP112 device does not acknowledge this byte, but switches the input filters on the SDA and SCL pins and the output filters on the SDA pin to operate in Hs-mode thus allowing transfers at up to 2.85 MHz. After the Hs-mode master code has been issued, the master transmits a two-wire slave address to initiate a data-transfer operation. The bus continues to operate in Hs-mode until a STOP condition occurs on the bus. Upon receiving the STOP condition, the TMP112 device switches the input and output filters back to fast-mode operation.

8.3.2.8 Timeout Function

The TMP112 device resets the serial interface if the SCL pin is held low for 30 ms (typical) between a start and stop condition. The TMP112 releases the SDA line if the SCL pin is pulled low and waits for a start condition from the host controller. To avoid activating the timeout function, maintain a communication speed of **at least 1 kHz** for SCL operating frequency.

8.3.2.9 Timing Diagrams

The TMP112 device is two-wire, SMBus and I²C interface-compatible. Figure 10 to Figure 13 describe the various operations on the TMP112. Parameters for Figure 10 are defined in *Timing Requirements*. Bus definitions are:

Bus Idle: Both SDA and SCL lines remain high.

Start Data Transfer: A change in the state of the SDA line, from high to low, while the SCL line is high, defines a START condition. Each data transfer is initiated with a START condition.

Stop Data Transfer: A change in the state of the SDA line from low to high while the SCL line is high defines a STOP condition. Each data transfer is terminated with a repeated START or STOP condition.

Data Transfer: The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the master device. It is also possible to use the TMP112 for single byte updates. To update only the MS byte, terminate the communication by issuing a START or STOP communication on the bus.

Acknowledge: Each receiving device, when addressed, is obliged to generate an Acknowledge bit. A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the Acknowledge clock pulse. Setup and hold times must be taken into account. On a master receive, the termination of the data transfer can be signaled by the master generating a *Not-Acknowledge* ('1') on the last byte that has been transmitted by the slave.

8.3.2.9.1 Two-Wire Timing Diagrams

See the *Timing Requirements*.

Figure 10. Two-Wire Timing Diagram

NOTE: (1) The values of A0 and A1 are determined by the ADD0 pin.

Figure 12. Two-Wire Timing Diagram for Read Word Format

Figure 13. Timing Diagram for SMBus ALERT

8.4 Device Functional Modes

8.4.1 Continuos-Conversion Mode

The default mode of the TMP112 device is continuos conversion mode. During continuous-conversion mode, the ADC performs continuos temperature conversions and stores each results to the temperature register, overwriting the result from the previous conversion. The conversion rate bits, CR1 and CR0, configure the TMP112 device for conversion rates of 0.25 Hz, 1 Hz, 4 Hz, or 8 Hz. The default rate is 4 Hz. The TMP112 device has a typical conversion time of 26 ms. To achieve different conversion rates, the TMP112 device makes a conversion and then powers down and waits for the appropriate delay set by CR1 and CR0. [Table 5](#) lists the settings for CR1 and CR0.

Table 5. Conversion Rate Settings

CR1	CR0	CONVERSION RATE
0	0	0.25Hz
0	1	1Hz
1	0	4Hz (default)
1	1	8Hz

After a power-up or general-call reset, the TMP112 device immediately begins a conversion as shown in [Figure 14](#). The first result is available after 26ms (typical). The active quiescent current during conversion is 40 μ A (typical at +27°C). The quiescent current during delay is 2.2 μ A (typical at +27°C).

(1) Delay is set by CR1 and CR0.

Figure 14. Conversion Start

8.4.2 Extended Mode (EM)

The extended mode bit configures the device for normal mode operation (EM = 0) or extended mode operation (EM = 1). In normal mode, the temperature register and the high and low limit registers use a 12-bit data format. Normal mode is used to make the TMP112 device compatible with the [TMP75](#) device.

Extended mode (EM = 1) allows measurement of temperatures above 128°C by configuring the temperature register and the high and low limit registers for 13-bit data format.

8.4.3 One-Shot/Conversion Ready Mode (OS)

The TMP112 device features a one-shot temperature-measurement mode. When the device is in shutdown mode, writing a 1 to the OS bit begins a single temperature conversion. During the conversion, the OS bit reads 0. The device returns to the SHUTDOWN state at the completion of the single conversion. After the conversion, the OS bit reads 1. This feature is useful for reducing power consumption in the TMP112 device when continuous temperature monitoring is not required.

As a result of the short conversion time, the TMP112 device can achieve a higher conversion rate. A single conversion typically occurs for 26 ms and a read can occur in less than 20 μ s. When using one-shot mode, 30 or more conversions per second are possible.

8.4.4 Thermostat Mode (TM)

The thermostat mode bit indicates to the device whether to operate in comparator mode (TM = 0) or interrupt mode (TM = 1).

8.4.4.1 Comparator Mode ($TM = 0$)

In Comparator mode ($TM = 0$), the Alert pin is activated when the temperature equals or exceeds the value in the $T_{(HIGH)}$ register and it remains active until the temperature falls below the value in the $T_{(LOW)}$ register. For more information on the comparator mode, see the [High- and Low-Limit Register](#) section.

8.4.4.2 Interrupt Mode ($TM = 1$)

In Interrupt mode ($TM = 1$), the Alert pin is activated when the temperature exceeds $T_{(HIGH)}$ or goes below $T_{(LOW)}$ registers. The Alert pin is cleared when the host controller reads the temperature register. For more information on the interrupt mode, see the [High- and Low-Limit Register](#) section.

8.5 Programming

8.5.1 Pointer Register

Figure 15 shows the internal register structure of the TMP112 device. The 8-bit Pointer Register of the device is used to address a given data register. The Pointer Register uses the two LSBs (see Table 13) to identify which of the data registers should respond to a read or write command. The power-up reset value of P1/P0 is '00'. By default, the TMP112 reads the temperature on power-up.

Figure 15. Internal Register Structure

Table 6 lists the pointer address of the registers available in the TMP112 device. Table 7 lists the bits of the Pointer Register byte. During a write command, bytes P2 through P7 must always be 0.

Table 6. Pointer Addresses

P1	P0	REGISTER
0	0	Temperature Register (Read Only)
0	1	Configuration Register (Read/Write)
1	0	T_{LOW} Register (Read/Write)
1	1	T_{HIGH} Register (Read/Write)

Table 7. Pointer Register Byte

P7	P6	P5	P4	P3	P2	P1	P0
0	0	0	0	0	0	Register Bits	

8.5.2 Temperature Register

The Temperature Register of the TMP112 device is configured as a 12-bit read-only register (setting the EM bit to 0 in the configuration register; see the [Extended Mode](#) section), or as a 13-bit read-only register (setting the EM bit to 1 in the configuration register) that stores the output of the most recent conversion. Two bytes must be read to obtain data and are listed in [Table 8](#) and [Table 9](#). Byte 1 is the most significant byte (MSB), followed by byte 2, the least significant byte (LSB). The first 12 bits (13 bits in extended mode) are used to indicate temperature. The least significant byte does not have to be read if that information is not needed.

Table 8. Byte 1 of Temperature Register

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
1	T11	T10	T9	T8	T7	T6	T5	T4
	(T12)	(T11)	(T10)	(T9)	(T8)	(T7)	(T6)	(T5)

Table 9. Byte 2 of Temperature Register⁽¹⁾

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
2	T3	T2	T1	T0	0	0	0	0
	(T4)	(T3)	(T2)	(T1)	(T0)	(0)	(0)	(1)

(1) Extended mode 13-bit configuration shown in parentheses.

8.5.3 Configuration Register

The Configuration Register is a 16-bit read/write register used to store bits that control the operational modes of the temperature sensor. Read/write operations are performed MSB first. [Table 10](#) lists the format and power-up and reset values of the configuration register. For compatibility, the first byte corresponds to the Configuration Register in the [TMP75](#) and [TMP275](#) devices. All registers are updated byte by byte.

Table 10. Configuration and Power-Up/Reset Formats

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
1	OS	R1	R0	F1	F0	POL	TM	SD
	0	1	1	0	0	0	0	0
2	CR1	CR0	AL	EM	0	0	0	0
	1	0	1	0	0	0	0	0

8.5.3.1 Shutdown Mode (SD)

The Shutdown mode bit saves maximum power by shutting down all device circuitry other than the serial interface, reducing current consumption to typically less than 0.5µA. Shutdown mode is enabled when the SD bit = '1'; the device shuts down when current conversion is completed. When SD = '0', the device maintains a continuous conversion state.

8.5.3.2 Thermostat Mode (TM)

The Thermostat mode bit indicates to the device whether to operate in Comparator mode (TM = 0) or Interrupt mode (TM = 1). For more information on Comparator and Interrupt modes, see the [High- and Low-Limit Registers](#) section.

8.5.3.3 Polarity (POL)

The polarity bit allows the user to adjust the polarity of the ALERT pin output. If the POL bit is set to 0 (default), the ALERT pin becomes active low. When the POL bit is set to 1, the ALERT pin becomes active high and the state of the ALERT pin is inverted. The operation of the ALERT pin in various modes is illustrated in [Figure 16](#).

Figure 16. Output Transfer Function Diagrams

8.5.3.4 Fault Queue (F1/F0)

A fault condition exists when the measured temperature exceeds the user-defined limits set in the T_{HIGH} and T_{LOW} registers. Additionally, the number of fault conditions required to generate an alert may be programmed using the fault queue. The fault queue is provided to prevent a false alert as a result of environmental noise. The fault queue requires consecutive fault measurements in order to trigger the alert function. Table 11 lists the number of measured faults that may be programmed to trigger an alert condition in the device. For T_{HIGH} and T_{LOW} register format and byte order, see the *High- and Low-Limit Registers* section.

Table 11. TMP112 Fault Settings

F1	F0	CONSECUTIVE FAULTS
0	0	1
0	1	2
1	0	4
1	1	6

8.5.3.5 Converter Resolution (R1 and R0)

The converter resolution bits, R1 and R0, are read-only bits. The TMP112 converter resolution is set on start up to 11 which sets the temperature register to a 12 bit-resolution.

8.5.3.6 One-Shot (OS)

When the device is in shutdown mode, writing a 1 to the OS bit begins a single temperature conversion. During the conversion, the OS bit reads 0. The device returns to the SHUTDOWN state at the completion of the single conversion. For more information on the one-shot conversion mode, see the *One-Shot/Conversion Ready Mode (OS)* section.

8.5.3.7 Extended Mode (EM)

The extended mode bit configures the device for normal mode operation ($EM = 0$) or extended mode operation ($EM = 1$). In normal mode, the temperature register and the high and low limit registers use a 12-bit data format. For more information on the extended mode, see the *Extended Mode (EM)* section.

8.5.3.8 Alert (AL)

The AL bit is a read-only function. Reading the AL bit provides information about the comparator mode status. The state of the POL bit inverts the polarity of data returned from the AL bit. When the POL bit equals 0, the AL bit reads as 1 until the temperature equals or exceeds $T_{(HIGH)}$ for the programmed number of consecutive faults, causing the AL bit to read as 0. The AL bit continues to read as 0 until the temperature falls below $T_{(LOW)}$ for the programmed number of consecutive faults, when it again reads as 1. The status of the TM bit does not affect the status of the AL bit.

8.5.4 High- and Low-Limit Register

The temperature limits are stored in the $T_{(LOW)}$ and $T_{(HIGH)}$ registers in the same format as the temperature result, and their values are compared to the temperature result on every conversion. The outcome of the comparison drives the behavior of the ALERT pin, which operates as a comparator output or an interrupt, and is set by the TM bit in the configuration register.

In Comparator mode (TM = 0), the ALERT pin becomes active when the temperature equals or exceeds the value in the $T_{(HIGH)}$ register and generates a consecutive number of faults according to fault bits F1 and F0. The ALERT pin remains active until the temperature falls below the indicated $T_{(LOW)}$ value for the same number of faults.

In interrupt mode (TM = 1), the ALERT pin becomes active when the temperature equals or exceeds the value in $T_{(HIGH)}$ for a consecutive number of fault conditions (as shown in [Table 11](#)). The ALERT pin remains active until a read operation of any register occurs, or the device successfully responds to the SMBus alert response address. The ALERT pin is also cleared if the device is placed in shutdown mode. When the ALERT pin is cleared, it becomes active again only when temperature falls below $T_{(LOW)}$, and remains active until cleared by a read operation of any register or a successful response to the SMBus alert response address. When the ALERT pin is cleared, the above cycle repeats, with the ALERT pin becoming active when the temperature equals or exceeds $T_{(HIGH)}$. The ALERT pin can also be cleared by resetting the device with the general-call Reset command. This action also clears the state of the internal registers in the device, returning the device to comparator mode (TM = 0).

Both operating modes are represented in [Figure 16](#). [Table 12](#) and [Table 13](#) list the format for the T_{HIGH} and T_{LOW} registers. The most significant byte is sent first, followed by the least significant byte. The power-up reset values for $T_{(HIGH)}$ and $T_{(LOW)}$ are:

- $T_{HIGH} = +80^{\circ}\text{C}$
- $T_{LOW} = +75^{\circ}\text{C}$

The format of the data for T_{HIGH} and T_{LOW} is the same as for the Temperature Register.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Calibrating for Improved Accuracy

Many temperature monitoring applications require better than 0.5°C accuracy over a limited temperature range. Knowing the offset of a temperature sensor at a given temperature in conjunction with the average temperature span (slope) error over a fixed range makes achieving this improved accuracy possible.

The TMP112 has three distinct slope regions that conservatively approximate its inherent curvature:

1. Slope1 applies over -40°C to +25°C
2. Slope2 applies over +25°C to +85°C
3. Slope3 applies over +85°C to +125°C

These slopes are defined in [Table 14](#) and shown in [Figure 17](#). It is important to note that each slope is increasing with respect to 25°C.

Table 14. Specifications for User-Calibrated Systems

PARAMETER	CONDITION	MIN	MAX	UNIT
Average Slope (Temperature Error vs Temperature) ⁽¹⁾	V ₊ = 3.3, -40°C to 25°C	-7	0	m°C/C
	V ₊ = 3.3, 25°C to 85°C	0	5	m°C/C
	V ₊ = 3.3, 85°C to 125°C	0	8	m°C/C

(1) User-calibrated temperature accuracy can be within ± 1 LSB because of quantization noise.

Figure 17. Accuracy and Slope Curves versus Temperature

[Equation 1](#) determines the worst-case accuracy at a specific temperature:

$$\text{Accuracy}_{(\text{worst-case})} = \text{Accuracy}_{(25^\circ\text{C})} + \Delta T \times \text{Slope} \quad (1)$$

9.1.1.1 Example 1: Finding Worst-Case Accuracy From -15°C to +50°C

As an example, if the user is concerned only about the temperature accuracy between -15°C to 50°C, the worst-case accuracy could be determined by using the two slope calculations shown in [Equation 2](#) and [Equation 4](#):

$$\text{Accuracy}(\text{worst-case}) = \text{Accuracy}(25^\circ\text{C}) + \Delta T \times \text{Slope} \quad (2)$$

$$\text{Accuracy}(\text{MAX}[-15^\circ\text{C} \text{ to } 25^\circ\text{C}]) = 0.3^\circ\text{C} + (-15^\circ\text{C} - 25^\circ\text{C}) \times \left(-7 \frac{\text{m}^\circ\text{C}}{\text{C}}\right) = 0.58^\circ\text{C} \quad (3)$$

$$\text{Accuracy}(\text{MAX}[25^\circ\text{C} \text{ to } 50^\circ\text{C}]) = \text{Accuracy}(25^\circ\text{C}) + \Delta T \times \text{Slope2}(\text{MAX}) \quad (4)$$

$$\text{Accuracy}(\text{MAX}[25^\circ\text{C} \text{ to } 50^\circ\text{C}]) = 0.3^\circ\text{C} + (50^\circ\text{C} - 25^\circ\text{C}) \times \left(5 \frac{\text{m}^\circ\text{C}}{\text{C}}\right) = 0.425^\circ\text{C} \quad (5)$$

The same calculations must be applied to the minimum case:

$$\text{Accuracy}(\text{MIN}[-15^\circ\text{C} \text{ to } 25^\circ\text{C}]) = \text{Accuracy}(25^\circ\text{C}) + \Delta T \times \text{Slope1}(\text{MIN}) \quad (6)$$

$$\text{Accuracy}(\text{MIN}[-15^\circ\text{C} \text{ to } 25^\circ\text{C}]) = -0.5^\circ\text{C} + \left[(-15^\circ\text{C} - 25^\circ\text{C}) \times \left(0 \frac{\text{m}^\circ\text{C}}{\text{C}}\right)\right] = -0.5^\circ\text{C} \quad (7)$$

$$\text{Accuracy}(\text{MIN}[25^\circ\text{C} \text{ to } 50^\circ\text{C}]) = \text{Accuracy}(25^\circ\text{C}) + \Delta T \times \text{Slope2}(\text{MIN}) \quad (8)$$

$$\text{Accuracy}(\text{MIN}[25^\circ\text{C} \text{ to } 50^\circ\text{C}]) = -0.5^\circ\text{C} + \left[(50^\circ\text{C} - 25^\circ\text{C}) \times \left(0 \frac{\text{m}^\circ\text{C}}{\text{C}}\right)\right] = -0.5^\circ\text{C} \quad (9)$$

Based on these calculations, a user can expect a worst-case accuracy of 0.58°C to -0.5°C in the temperature range of -15°C to 50°C .

9.1.1.2 Example 2: Finding Worst-Case Accuracy From 25°C to 100°C

If the desired temperature range falls in the region of slope 3, first calculate the worst-case value from 25°C to 85°C and add it to the change in temperature multiplied by the span error of slope 3. As an example, consider the temperature range of 25°C to 125°C as shown in [Equation 10](#):

$$\text{Accuracy}(\text{MAX}[25^\circ\text{C} \text{ to } 100^\circ\text{C}]) = \text{Accuracy}(25^\circ\text{C}) + \Delta T \times \text{Slope2}(\text{MAX}) + \Delta T \times \text{Slope3}(\text{MAX}) \quad (10)$$

$$\text{Accuracy}(\text{MAX}[25^\circ\text{C} \text{ to } 100^\circ\text{C}]) = 0.3^\circ\text{C} + (85^\circ\text{C} - 25^\circ\text{C}) \times \left(4.5 \frac{\text{m}^\circ\text{C}}{\text{C}}\right) + (100^\circ\text{C} - 85^\circ\text{C}) \times \left(8 \frac{\text{m}^\circ\text{C}}{\text{C}}\right) = 0.69^\circ\text{C} \quad (11)$$

Then perform the same calculation for the minimum case as shown in [Equation 12](#):

$$\text{Accuracy}(\text{MIN}[25^\circ\text{C} \text{ to } 100^\circ\text{C}]) = \text{Accuracy}(25^\circ\text{C}) + \Delta T \times \text{Slope2}(\text{MIN}) + \Delta T \times \text{Slope3}(\text{MIN}) \quad (12)$$

$$\text{Accuracy}(\text{MIN}[25^\circ\text{C} \text{ to } 100^\circ\text{C}]) = -0.5^\circ\text{C} + \left[(85^\circ\text{C} - 25^\circ\text{C}) \times \left(0 \frac{\text{m}^\circ\text{C}}{\text{C}}\right)\right] + \left[(100^\circ\text{C} - 85^\circ\text{C}) \times \left(0 \frac{\text{m}^\circ\text{C}}{\text{C}}\right)\right] = -0.5^\circ\text{C} \quad (13)$$

9.1.2 Using the Slope Specifications with a 1-Point Calibration

The initial accuracy assurance at $+25^\circ\text{C}$ with the slope regions provides an accuracy that is high enough for most applications; however, if higher accuracy is desired, this increase can be achieved with a 1-point calibration at $+25^\circ\text{C}$. This calibration removes the offset at room temperature, thereby reducing the source of error in a TMP112 temperature reading down to the curvature. [Figure 18](#) shows the error of a calibrated TMP112.

Figure 18. Calibrated Accuracy and Slope Curves versus Temperature

Using the previous example temperature range of 0°C to +50°C, the worst-case temperature error is now reduced to the worst-case slopes because the offset at +25°C (that is, the maximum and minimum temperature errors of +0.3°C and –0.5°C) is removed. Therefore, a user can expect the worst-case accuracy to improve to +0.175°C.

9.1.2.1 Power Supply-Level Contribution to Accuracy

The superior accuracy that can be achieved with the TMP112 device is complemented by the immunity-to-DC variations from a 3.3-V supply voltage. This immunity is important because it spares the user from having to use another LDO regulator to produce 3.3 V to achieve accuracy. Nevertheless, the noise quantization that results from changing supply can add some slight change in temperature measurement accuracy. As an example, if the user chooses to operate the device at 1.8 V, the worst-case expected change in accuracy can be calculated with **Equation 14**:

$$\text{Accuracy(PSR)} = \pm(V+ - 3.3 \text{ V}) \times \left[\frac{0.25^\circ\text{C}}{V} \right] \quad (14)$$

$$\text{Accuracy(PSR)} = \pm(1.8 \text{ V} - 3.3 \text{ V}) \times \left[\frac{0.25^\circ\text{C}}{V} \right] = \pm0.375^\circ\text{C} \quad (15)$$

This example is a worst-case accuracy contribution as a result of variation in power supply that should be added to the accuracy plus the slope maximum.

9.2 Typical Application

The TMP112 device is used to measure the PCB temperature of the board location where the device is mounted. The programmable address options allow up to four locations on the board to be monitored on a single serial bus.

NOTE: The SCL, SDA, and ALERT pins require pullup resistors.

Figure 19. Typical Connections

9.2.1 Design Requirements

The TMP112 device requires pullup resistors on the SCL, SDA, and ALERT pins. The recommended value for the pullup resistors is 5-kΩ. In some applications the pullup resistor can be lower or higher than 5 kΩ but must not exceed 3 mA of current on any of those pins. A 0.01-µF bypass capacitor on the supply is recommended as shown in [Figure 19](#). The SCL and SDA lines can be pulled up to a supply that is equal to or higher than V+ through the pullup resistors. To configure one of four different addresses on the bus, connect the ADD0 pin to either the GND, V+, SDA, or SCL pin.

9.2.2 Detailed Design Procedure

The TMP7112 device should be placed in close proximity to the heat source that must be monitored, with a proper layout for good thermal coupling. This placement ensures that temperature changes are captured within the shortest possible time interval. To maintain accuracy in applications that require air or surface temperature measurement, care should be taken to isolate the package and leads from ambient air temperature. A thermally-conductive adhesive is helpful in achieving accurate surface temperature measurement.

The TMP112 device is a very low-power device and generates very low noise on the supply bus. Applying an RC filter to the V+ pin of the TMP112 device can further reduce any noise that the TMP112 device might propagate to other components. $R_{(F)}$ in [Figure 20](#) should be less than 5 kΩ and $C_{(F)}$ should be greater than 10 nF.

Typical Application (continued)

Figure 20. Noise Reduction Techniques

9.2.3 Application Curves

Figure 21 shows the step response of the TMP112 device to a submersion in an oil bath of 100°C from room temperature (27°C). The time-constant, or the time for the output to reach 63% of the input step, is 0.8 s. The time-constant result depends on the printed circuit board (PCB) that the TMP112 device is mounted. For this test, the TMP112 device was soldered to a two-layer PCB that measured 0.375 in × 0.437 in.

Figure 21. Temperature Step Response

10 Power Supply Recommendations

The TMP112 device operates with power supply in the range of 1.4 to 3.6 V. The device is optimized for operation at 3.3-V supply but can measure temperature accurately in the full supply range. Refer to the [Power Supply-Level Contribution to Accuracy](#) section for more information about the power supply impact on the accuracy of the device.

A power-supply bypass capacitor is required for proper operation. Place this capacitor as close as possible to the supply and ground pins of the device. A typical value for this supply bypass capacitor is 0.01 μF . Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise.

11 Layout

11.1 Layout Guidelines

Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is $0.01\ \mu F$. Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies. Pull up the open-drain output pins (SDA, SCL and ALERT) through $5\ k\Omega$ pullup resistors.

TMP112AIDRLR	ACTIVE	SOT	DRL	6	4000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	OBS	Samples
TMP112AIDRLT	ACTIVE	SOT	DRL	6	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	OBS	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

DRL (R-PDSO-N6)

PLASTIC SMALL OUTLINE

DRL (R-PDSO-N6)

PLASTIC SMALL OUTLINE

Example Board Layout

Example Stencil Design
(Note E)

4208207-3/E 06/12

- NOTES:
- All linear dimensions are in **millimeters**.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
 - Maximum stencil thickness 0,127 mm (5 mils). All linear dimensions are in millimeters.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Side aperture dimensions over-print land for acceptable area ratio > 0.66. Customer may reduce side aperture dimensions if stencil manufacturing process allows for sufficient release at smaller opening.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
